

OVER 1 MILLION INNERDUCT METERS REMOVED
ZERO DOWN TIME

A Breakthrough in Conduit Space Maximization

What is MaxSpace[®]?

MaxSpace is a patented no-dig technology and construction service. It safely removes existing innerduct from around active fiber optic cables with virtually no load on the cables and no interruption of service.

As MaxSpace removes innerducts, cables migrate to the bottom of the outer conduit. After all innerducts are removed, up to **90% conduit space is recovered** allowing up to nine (9) more cables to be placed in the reclaimed space of a conduit that was once considered full.

The MaxSpace Solution

The conduit space recovery machine uses a split metal sleeve to protect the active cable while the innerduct is extracted. With the innerduct removed, incumbent cables settle to the bottom of a conduit and allow for multiple MaxCell packs and new cable to be installed, greatly increasing the existing conduit's cable capacity.
